PROMADIS Inventory

Effective stock level control ...

To help drive customer service &

Manage inventory investment levels.

PROMADIS Inventory is a family of powerful software utilities that manage stock levels according to user defined business rules.

PROMADIS Inventory was developed by analysts and programmers who have considerable experience in distribution and the systems that this requires. As such, this PROMADIS Inventory offers:

- Flexibility in the controls applied to stock locations and replenishment
- Reliable processing techniques which produce totally accurate information
- Simple screens and reports to analyze the vast array of inventory-related information gathered every day
- Comprehensive capabilities to assist with rapid response to questions
- Logical functionality to reduce staff training and increase productivity

Central to the design of PROMADIS Inventory is the recognition that the system must contribute to customer service excellence. And this is achieved, in part, by ensuring a constant focus on such things as: the accurate forecasting of supplier lead-times; accurate location controls; efficient stock handling methods; continuous stock taking; and so on.

PROMADIS Inventory can readily cater for multiple warehouses and/or multiple companies.

Powerful location control can automatically recommend where stock should be placed and maintained. At the same time, staff can be allowed to select alternate locations.

Closely allied to location management is the system's capacity to track defined parcels of stock for 'Use By Date' control or for subsequent handling based on serial, batch or lot numbers.

MRP (Materials Requirements Planning) is a powerful requirements planning facility which is provided with PROMADIS Inventory. It can potentially contribute to stock forecasting accuracy as it not only looks at actual inventory requirements, but also at forecasted requirements and supplier lead times.

Other core facilities and features include, stock receipting, stock take, sales forecasting, supplier price lists and breaks, comprehensive reporting and enquiries.

An unlimited number of price lists are supported which, in turn, can be based on mark up, quantity break or set price. Lists can also be automatically or manually updated dependant on user requirements.

The comprehensive range of standard reports includes those that help manage slow moving and on-stock levels, empty bins, stock locations, supplier relationships, supplier rebates, valuations, client pricing and budgeting.

PROMADIS Inventory features include:

- Multiple warehousing
- Multiple areas within warehouse
- Multiple bins within area
- Multiple stock locations
- Automatic replenishment of pick face locations
- Multiple price lists
- Use By Date, Batch and Serial Number Tracking
- Barcode processing and tracking extensively supported
